Treating Phonological Disorders in Children: 
Metaphon - Theory to Practice

by Elizabeth Dean

Treating phonological disorders in children through Metaphon provides a visual and auditory feedback system that can help children focus on specific phonemes. The Metaphon system includes a series of games and activities designed to engage children in the treatment of phonological disorders.

The Metaphon system is based on the theory of event-related processing (Hickok, 2009) and integrates visual and auditory feedback to help children develop awareness of their speech sounds. The Metaphon system is designed to be used in conjunction with other speech and language treatments and can be adapted to individual children's needs.

The Metaphon system includes a series of games and activities that are designed to engage children in the treatment of phonological disorders. These games and activities are designed to be fun and engaging, and they help children develop awareness of their speech sounds.

The Metaphon system is based on event-related processing theory, which suggests that children's perception of speech sounds is influenced by the way in which they are processed. Event-related processing theory suggests that children's perception of speech sounds is influenced by the way in which they are processed. The Metaphon system is designed to help children develop awareness of their speech sounds by providing them with visual and auditory feedback.

The Metaphon system is designed to be used in conjunction with other speech and language treatments and can be adapted to individual children's needs. The Metaphon system can be used with children of all ages and abilities, and it can be used in a variety of settings, including schools, clinics, and homes.
